

Cable Trays

Welded Wire Mesh Cable trays are support structures that organize and protect cables in buildings and other structures. They are used to hold and route cables for power, data, and communication.

Cable trays are made of hard drawn smooth wire and welded at the intersection. This product can be used in commercial, industrial, and residential settings.

Cable trays provide many benefits, including:

ORGANIZING

- Cable trays provide an organized and accessible route for cables, reducing clutter and simplifying maintenance.

PROTECTION

- Cable trays protect cables from physical damage, environmental factors, and chemical interactions.

SUPPORT

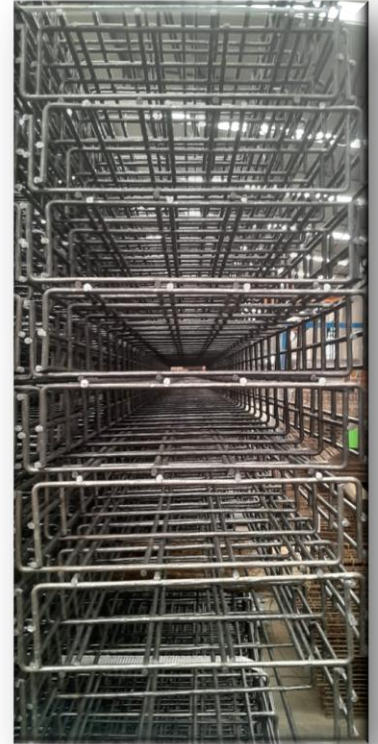

- Cable trays provide additional support and prevent cables from drooping, which could damage the circuit's performance.

VENTILATION

- The perforations in cable trays enable water drainage and ventilation.

HIDING CABLES

- In buildings with no paneled ceiling, cable trays can be a great option for hiding cables whilst keeping them organized.

Cable trays are available in a wide range of sizes and configurations and can be modified or expanded to accommodate additional cables
